

Practice 1

<input checked="" type="checkbox"/> Review	<input type="checkbox"/>
 files	

Problem 1

Primitive	Meaning
Socket	a communications connection point (endpoint) for network I/O(read & write)
Bind	assigns an address to a socket
Listen	called only by TCP server, converts active socket into passive socket and specifies the queue size.
Accept	called by server and accept the listening socket
Connect	used by TCP client to make a connection to (TCP) server
Send	sends data on the socket
Receive	receives data on a socket
Close	closes a socket and terminate connection

Problem 2

ipv4 address의 문자열 표현(Dotted-Decimal Notation 형태)을 unsigned long 값을 가지도록 변환하는 과정을 거치면 초기화에 사용할 수 있다.

```
char * addr = "127.0.0.1";
unsigned long conv_addr = inet_addr(addr);
```

```
serv_addr.sin_addr.s_addr = conv_addr;
```

`htonl(INADDR_ANY)` 부분을 `conv_addr` 로 대체해 쓸 수 있다.
